

Hanging Treatments from Medallions

Another Creation from Donna

Just recently I was asked to create a Kingston valance hung on medallions. The designer selected medallions with posts 1½" in diameter. She had no specifications as to how I did this. So I decided I wanted the bell or

horn to lay straight across at the edge of the Kingston. This required me to develop a way to hang the Kingston without cinching up the horn. Here are the instructions for how I accomplished this.

INSTRUCTIONS:

Create the size loop you need.

1. Create the size loop you will need for the job.

Line up the bell or horn with the top of the Kingston.

2. Line up the bell or horn with the top of the Kingston to establish the finished length of the bell.

Pin the bell or horn in place.

3. Pin the bell or horn in place and cut off the excess.

Fold under the raw edges.

4. Fold the raw edges of the bell to the inside at the finished top edge of the bell, and press.

Remove the paper off the double-sided tape.

Pull the paper off of the double-side tape under the bell.

9. Now it is time to remove the paper off the double-sided tapes. First, pull the paper off the inside of the bell and adhere it together.

10. Next, pull the paper off of the double-sided tape under the bell. That was the piece we applied over the loop. Adhere the bell to the face of the Kingston.

11. Test mounting told me I had found the best answer to this challenge. The bell stayed straight across the top of the Kingston, and the loop supports all the weight as I had hoped. It was a solution that worked out perfectly! I hope it works for you.
